SUMMARY

A backend developer with a strong foundation in AI and systems engineering, driven by a passion for building intelligent infrastructure at scale. My journey spans core API development to multi-agent AI systems, demonstrating consistent growth toward one goal — engineering the backend layer that powers the next generation of AI applications.

TECHNICAL SKILLS

Languages: Python, C, C++, JavaScript

Backend: FastAPI, REST APIs, Async Handling, Middleware, Pydantic, HTML5, CSS3

AI & LLM: LangChain, LangGraph, LangSmith, MCP, RAG, FAISS, Prompt Engineering, Agentic AI Workflows

Databases: MySQL, FAISS Vector Search

Core CS: DSA, OOP, Operating Systems, Computer Networks, DBMS, System Design

Tools: Git, Docker, LangSmith, Ollama, Wireshark

EXPERIENCE

Summer Intern, Financial Technology — Uparjan Enterprises

May 2025 – Sep 2025

- Optimized 5+ financial service workflows, contributing to a 20% improvement in task completion rates by redesigning key user journeys.
- Developed backend API enhancements and data handling improvements, reducing average processing time by 15%.
- Translated business requirements into structured technical specs, enabling the team to deliver 3 features 2 weeks ahead of schedule.

PROJECTS

MCP Artifact Store | [GitHub ↗](#) FastAPI · FastMCP · PostgreSQL · SQLAlchemy · LangGraph · React · Docker

- Architected and deployed an open-source MCP server enabling shared artifact storage across multi-agent pipelines, reducing inter-agent context window payload from ~1.6KB to 12 bytes per handoff.
- Built dual-interface system — FastAPI HTTP endpoints for a React dashboard and FastMCP tools for LangGraph agents — both backed by a single PostgreSQL service layer with atomic audit logging.
- Implemented per-artifact access control, TTL enforcement, and creator-only deletion with full audit trail across READ, WRITE, LIST, and DELETE operations.
- Deployed full stack to production: FastAPI and FastMCP on Render, PostgreSQL on Render managed DB, React dashboard on Vercel — live at mcp-artifact-store.vercel.app.

RAG Pipeline Optimizer | [GitHub ↗](#) FastAPI · FAISS · OpenAI API · SQLAlchemy · LangSmith · React

- Architected a production-grade RAG system with PDF ingestion, adaptive chunking, and FAISS vector indexing, reducing retrieval latency by ~40%.
- Built multi-pipeline answer generation (strict, citation-based, explanatory) with LLM-based judge evaluation, achieving 90%+ answer quality consistency.
- Implemented cost- and latency-aware optimization layer using weighted scoring, cutting inference costs by 35% without degrading output quality.
- Engineered guardrails — token-budget enforcement, similarity threshold filtering, hallucination auto-rejection — reducing hallucination rate by 60%.

Uparjan – Full-Stack Web Application | [GitHub ↗](#) React · FastAPI · REST APIs · MySQL · Git

- Developed full-stack app with React frontend and FastAPI backend, serving 200+ concurrent users with clean RESTful API design and client-server separation.
- Designed 15+ backend endpoints with Pydantic validation, structured routing, and optimized MySQL queries reducing average response time by 25%.

EDUCATION

PES University, Bengaluru

Aug 2022 – May 2026

B.Tech in Electronics and Communication Engineering | CGPA: 7.53 / 10

LEADERSHIP & ACTIVITIES

Technical Team Member — The Alcoding Club, PES University

- Designed 20+ advanced DSA problems used by 100+ students, elevating average contest performance by 30%; mentored 15+ peers weekly.

Committee Member — Weal Club (EVM Committee)

- Coordinated logistics for 5+ university events with 300+ attendees, ensuring zero operational failures.
